Crop Disease Analysis Report

Generated: 27 April 2026 03:10 | Location: Khairai, Punjab

A. Prediction Summary

Field	Result
Status	DISEASE DETECTED
Crop	Tomato
Detected Disease	Tomato Tomato Late Blight
Confidence	94.2%
Risk Level	High

B. Weather Conditions

Parameter	Value
Temperature	27.5 deg C
Humidity	74.0%
Wind Speed	12.0 km/h
Rainfall	1.5 mm
Condition	Partly Cloudy

C. Weather Risk Analysis

Overall Risk Score: 72 / 100 | Risk Level: High

Humidity is elevated (70-80%), which significantly increases the risk of fungal and bacterial disease spread. Apply preventive fungicides if not already done. Light rainfall prolongs leaf wetness duration, which can facilitate spore germination and infection.

D. Immediate Recommendation

Isolate affected plants immediately and begin treatment.

- Isolate and mark all visibly affected plants immediately.
- Document spread by photographing surrounding plants.

- Begin chemical or organic treatment within 24-48 hours.
- Inform neighbouring farmers if outbreak risk is High.

E. Treatment Plan

1. Apply Mancozeb 75 WP (2.5 g/L) every 7 days for 3 cycles.
2. Organic: neem oil 5 ml/L with surfactant.

F. Prevention Strategies

- Maintain 40 cm plant spacing.
- Use drip irrigation.
